

**Kuhlmann**, *Arithmetic of cuts in ordered abelian groups and of ideals over valuation rings*

Dedekind cuts are in one-to-one correspondence with their upper cut sets, which are final segments. We investigate existence, uniqueness and maximality of solutions  $T$  for equations  $S_1 + T = S_2$  and inequalities  $S_1 + T \subseteq S_2$  where  $S_1$  and  $S_2$  are final segments of ordered abelian groups. This yields information about the corresponding equalities and inequalities for cuts. We apply our results to investigate existence, uniqueness and maximality of solutions  $J$  for equations  $I_1 J = I_2$  and inequalities  $I_1 J \subseteq I_2$  where  $I_1$  and  $I_2$  are ideals of valuation rings. This enables us to compute the annihilators of quotients of the form  $I_1/I_2$ . The results are applied in [1, 2] to compute the annihilators of Kähler differentials for Galois extensions of prime degree of valued fields.

Partial results in this direction had been obtained by Paulo Ribenboim in [4]. In my talk I will discuss in detail the progress that has been made since his work.

This is joint work with Katarzyna Kuhlmann ([3]).
